

THE HETEROPTERA SPECIES (HEMIPTERA, HETEROPTERA) PRESERVED IN THE ENTOMOLOGICAL COLLECTION IN THE MUZEUM OF INSTITUTE OF ZOOLOGY, MOLDOVA STATE UNIVERSITY

DERJANSCHI Valeriu

Abstract. 6749 specimens of 760 species of heteroptera (696 terrestrial and 64 aquatic) and 338 genera (309 terrestrial and 29 aquatic), belonging to 34 families – 22 terrestrial and 12 aquatic –, are stored in the entomological collection of Museum from the Institute of Zoology, State University of Moldova. The collection possesses paratypes of two species: *Cremnocephalus matocqi* Magnien, 2000 (Miridae) and *Sciocoris poddubnyi* Derzhansky, 1994 (Pentatomidae). The collection contains all species of invasive heteroptera that have appeared in the Republic of Moldova in recent years. Two species – *Paracorixa kiritshenkoi* (Lundblad, 1933) and *Eumecotarsus breviceps* (Reuter, 1878) have been captured in Republic of Moldova at the limits of their distribution area.

Keywords: entomological collections, Hemiptera, Heteroptera, Institute of Zoology, Moldova State University.

Rezumat. Speciile de heteroptere (Hemiptera, Heteroptera) conservate în colecția entomologică din Muzeul Institutului de Zoologie, Universitatea de Stat din Moldova. În colecția entomologică a Muzeului de la Institutul de Zoologie, Universitatea de Stat din Moldova, sunt depozitate 6749 exemplare din 760 specii de heteroptere (696 terestre și 64 acvatice) și 338 genuri (309 terestre și 29 acvatice), care aparțin la 35 familii – 23 terestre și 12 acvatice. Colecția posedă paratipuri a două specii: *Cremnocephalus matocqi* Magnien, 2000 (Miridae) și *Sciocoris poddubnyi* Derzhansky, 1994 (Pentatomidae). Colecția conține toate speciile de heteroptere invazive care au apărut în Republica Moldova în ultimii ani. Două specii – *Paracorixa kiritshenkoi* (Lundblad, 1933) și *Eumecotarsus breviceps* (Reuter, 1878) au fost capturate în Republica Moldova la limita ariei lor de răspândire.

Cuvinte cheie: colecții entomologice, Hemiptera, Heteroptera, Institutul de Zoologie, Universitatea de Stat din Moldova.

INTRODUCTION

Entomological collections are an important part of any systematic and faunal studies of insects. Sometimes they contain information without which it is impossible to obtain good scientific data. Therefore, publishing these materials and placing them in the wide scientific circuit is highly indispensable.

MATERIALS AND METHODS

The heteroptera collected by author between 1981-2023 and stored in the Entomological Museum of the Institute of Zoology of MSU served as entomological material for this article. Previous collections by laboratory colleagues and donations from specialists of 20 countries from the Palearctic Region are also included.

The collection is kept in 108 boxes with dimensions of 36 by 41 centimeters, made of wood and glass.

RESULTS AND DISCUSSIONS

Table 1 shows the totalization data as follows: name of the family and species (in alphabetical order), number of the box in the collection, quantity of the specimens and the country from which the material originates. Therefore, 6749 specimens of 760 species of heteroptera (696 terrestrial and 64 aquatic) and 338 genera (309 terrestrial and 29 aquatic) are stored in the mentioned collection, belonging to 35 families – 23 terrestrial and 12 aquatic (BUŞMACHIU et al., 2023).

It should be mentioned, for fellow entomologists-systematists, that the collection possesses paratypes of two species: *Cremnocephalus matocqi* Magnien, 2000 (Miridae) and *Sciocoris poddubnyi* Derzhansky, 1994 (Pentatomidae).

At the same time, the collection contains all species of invasive heteroptera that have appeared in the Republic of Moldova in recent years – *Corythucha arcuata* (Say, 1832), *Corythucha ciliata* (Say, 1832) and *Oxycarenus lavaterae* (Fabricius, 1787) (all from the Miridae family), *Leptoglossus occidentalis* Heidemann, 1910 (Coreidae), *Halyomorpha halys* (Stål, 1855) and *Nezara viridula* (Linnaeus, 1758) from Pentatomidae family. This list can be extended.

The information about species that have been captured in Republic of Moldova at the limits of their distribution area is not less valuable. For example, the species *Paracorixa kiritshenkoi* (Lundblad, 1933) (Corixidae) and *Eumecotarsus breviceps* (Reuter, 1878) (Miridae) were cited from the North Caucasus.

Table 1. The Heteroptera preserved in the entomological collection from the Museum of the Institute of Zoology, Republic of Moldova.

CONCLUSIONS

6749 specimens of 760 species of heteroptera (696 terrestrial and 64 aquatic) and 338 genera (309 terrestrial and 29 aquatic) are stored in the entomological collection of the Museum from the Institute of Zoology, Moldova State University, belonging to 35 families – 23 terrestrial and 12 aquatic.

The collection possesses paratypes of two species: *Cremnocephalus matocqi* Magnien, 2000 (Miridae) and *Sciocoris poddubnyi* Derzhansky, 1994 (Pentatomidae).

The collection contains all species of invasive heteroptera that have appeared in the Republic of Moldova in recent years.

Two species (*Paracorixa kiritshenkoi* (Lundblad, 1933) and *Eumecotarsus breviceps* (Reuter, 1878) have been captured in the Republic of Moldova at the limits of their distribution area.

ACKNOWLEDGMENT

The research was funded by the Research Subprogram 010701 – “Evaluation of the structure and functioning of the animal world and aquatic ecosystems under the influence of biotic and abiotic factors in the context of ensuring ecological security and the well-being of the population”.

We would like to thank to our colleagues from France, Armand MATOCQ and Philippe MAGNIEN, as well as our colleague Andrei ZUBOV from Chișinău for the provided entomological material, which honors our collection.
